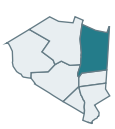
PathwayAI | Dutchess County

Lyme Disease Burden & Community Action



Mid-Hudson · location only

Prepared 2026-11-04 · Public-data planning brief · Version 1.11

Meeting snapshot · Public evidence and proposed actions for local review

Reported cases · 2024	County rate per 100,000 · 2024	State rate per 100,000 · 2024
1,060	355.5	109.8

Discussion priority: Getting to care

Question for the meeting

Should a county care-navigation team investigate a small ride-navigation pilot with willing residents?

Existing county context: the Dutchess 2025–2030 plan describes access disparities and referral approaches. Discuss how support could complement existing work. [7]

Mid-Hudson counties and state comparison

Area	Reported cases · 2024	Rate per 100,000 · 2024
Dutchess	1,060	355.5
Orange	964	237
Putnam	294	299.2
Rockland	461	135.3
Sullivan	385	482.6
Ulster	841	461.2
Westchester	1,125	113.2
New York State	21,632	109.8

Same NYSDOH 2024 reporting year/source. Cases describe residents, not necessarily exposure location; reported rates are not personal risk estimates.

Study-based economic illustration

USD 2.15 million · 2016 dollars

Reported cases × Hook study societal mean. This illustrates scale, not measured county spending or predicted savings.

Optional 2025 purchasing-power comparison: USD 2.89 million

General inflation · 11 available months; October missing · not a complete annual average

Sources [1, 5, 13]; calculation and methods: page 4.

Suggested meeting flow

1. Confirm the local evidence. 2. Discuss one support priority. 3. Check existing services and agree a next step.

Public-data planning brief. Resource context and follow-up: page 2; local planning and research: page 3; references and methods: page 4.

Resources & practical next steps

Healthcare resources and population context

Indicator	Value	Period
Primary-care physicians	233	2023
Hospitals	2	2023
Hospital beds	404	2023
Uninsured residents under age 65	4.7%	2022
Poverty (population with poverty status determined)	8%	2023
Language other than English at home · age 5+	16.2%	ACS 2020–2024

General population/resource context, not Lyme-specific need, appointment availability or interpreter demand. Selected insurance/poverty fields supply no margin of error.

Reported Lyme rates by year · per 100,000 residents

2022	2023	2024
394.6	358.9	355.5

Pre-2022 rates excluded because surveillance definitions changed. Different sources do not establish causes; see methods on page 4.

Existing local resources to check

Tick Task Force · Tick-borne disease prevention and education [10]

Mobile Health Unit · Community outreach and access [11]

Directory snapshot: confirm current activity, eligibility and capacity. Mobile outreach is not verified Lyme treatment; no partnership is implied.

1. Confirm the need with residents

Travel, appointment and referral barriers

No county-specific patient-reported findings are established in this brief.

2. Review an existing-service response

Ask willing residents and transport providers to review ride eligibility, accessibility and appointment coordination.

Who could help: Patient and caregiver representatives, transport services and care navigators

Actions to discuss · Public health departments

- Share tick-prevention information through local events and trusted community channels.
- Review county surveillance alongside service availability; ask residents which barriers need attention.
- Bring residents and potential partners together to choose one support priority and agree how to follow up.

3. Agree responsibility and follow-up

Check services, appointment capacity, staff time, funding and who would take responsibility before proposing a pilot. Define consent and privacy arrangements before any collection.

Choose a common period, such as 30 days. Record the starting situation, support received, missing answers and needs still unmet.

For this priority: Requested and completed accessible rides; appointments attended; travel spending; support still needed

Proposed actions, not adopted services or demonstrated savings. Professional feedback: source clarity, assumptions, usefulness and missing local factors.

Local planning & research context

What This Means for Local Planning

1. Prevention outreach

Dutchess's 2024 reported rate was 355.5 per 100,000, above the state rate of 109.8. Where could trusted local channels help share prevention information? [2]

2. Care access

4.7% of residents under age 65 were uninsured in 2022. Could care navigators help residents ask about sliding fees and coverage options? This is general population context, not Lyme-specific need or available appointments. [4]

3. A local action to review

Should a county care-navigation team investigate a small ride-navigation pilot with willing residents? Confirm needs with residents and check existing services before selecting a response.

Planning questions for local review; population indicators do not establish Lyme-specific need or available services.

Fit with the Dutchess 2025–2030 health plan

Local priorities and existing pathways [7]

• The plan describes geographic and disability-related disparities in care access. (pp. 5)

• Among 830 residents participating in informal event voting, insurance coverage and access to care was a leading topic. This was not a representative survey or a Lyme sample. (pp. 6–7)

• The plan describes social-needs referrals through Hudson Valley Care Coalition and Unite Us; its mobile screening pathway concerns blood pressure, not Lyme. (pp. 9–11)

Could reviewed Lyme visit summaries and support questions complement existing care-navigation and referral work? PathwayAI proposal for discussion; no county endorsement, service commitment or referral-platform integration. Verify current services with partners.

Selected CHIP priorities concern nutrition security, chronic-disease prevention and substance-misuse/overdose prevention; these are not an adopted Lyme program.

What published research adds

External study populations provide context, not county patient findings.

Hook et al. (2022) [5]

901 patient-cost participants; 613 societal-cost participants · Recruitment 2014–2016; 2016 dollars

Medical, nonmedical and productivity costs inform the existing illustration.

Population and limits: Selected reported cases in four high-incidence states; excluded non-English speakers and nonacute disease.

Adrion et al. (2015) [14]

52,795 Lyme patients; 263,975 matched controls · Claims 2006–2010; 12-month follow-up

Documents healthcare spending and utilization after Lyme diagnosis.

Population and limits: Commercially insured ages 0–64; not uninsured patients or a full household-cost estimate.

Johnson et al. (2014) [15]

3,090 selected survey respondents · Survey 2013; persistent symptoms after treatment

Documents reported work disruption, expenses and quality-of-life impacts.

Population and limits: Self-selected, self-reported persistent-illness sample; not all Lyme cases or a county disability rate.

How to use this evidence

Use these studies to discuss spending, work disruption and daily-life impacts with local residents. Hook remains the sole study-cost basis for the county illustration. Study estimates are not added together or applied as local disability rates.

County-specific patient findings would require a defined local collection and review process. References and detailed methods follow on page 4.

References & methods

Original study basis

1,060 reported cases × USD 2,032 study mean = USD 2,153,920 (2016 dollars).

Hook et al. (published 2022): 613 participants in societal analysis; reported cases recruited in four high-incidence states during 2014–2016. Societal: medical, nonmedical and productivity costs; components are already included.

Applying this study mean to reported county cases is an assumption; the result is not measured local spending. No adjustment for underreporting or local case mix. No causal savings or disability probabilities are inferred.

Hook excluded non-English speakers and nonacute disease. The study does not represent every local household or continuing lifetime costs.

Optional inflation comparison

General CPI factor approximately 1.34; calculations use the full-precision factor retained in the methods CSV. Adjusted study mean approximately USD 2,726 per participant (rounded for display).

2016 uses 12 monthly observations; 2025 uses 11 available months. October is missing; no imputation. This is not a verified official full-year annual average or medical-care inflation adjustment. It changes purchasing power, not case mix, treatment patterns or local prices.

Published cost components · 2016 dollars per participant

Medical: USD 1,333; other expenses and productivity combined: USD 699; total societal mean: USD 2,032.

The combined amount is a derived residual, not a separately reported mean. Caregiving is not separately valued here. Components are already included in the total; do not add them again.

Verification and interpretation

Existing source snapshots; newer official releases have not been verified for this brief. Official rates are reproduced; exact rate-denominator vintage is not independently verified. Pre-2022 rates are excluded because surveillance definitions changed.

Census language context is an existing QuickFacts snapshot, not a fresh pull or a measure of English proficiency. HRSA field years are not substituted with newer Census periods. Initiative links require current local verification; no listing does not mean no services exist.

Location map uses the app’s bundled county boundaries for orientation only; underlying boundary vintage is not independently verified. It is not an official county map or a disease-risk map.

Public evidence and proposed planning actions only. No session stories, personal records or synthetic patient cards are included.

Discussion brief, not a county demand assessment, benefits decision, funded service or adopted county plan. No county or organizational endorsement is implied.
