Visit & Cost Card

Fictional demonstration | Past 30 days

FICTIONAL EXAMPLE. These entries illustrate the record format. They are not a patient report, expected bill or treatment recommendation.

My story

I felt tired after an outdoor walk and would like help preparing for a visit. I paid $180 for medical care and $45 for travel. I missed 3 workdays, and an unpaid caregiver provided 8 hours of help.

Money I paid

Category	Recorded amount
Medical care	$180.00
Travel and other expenses	$45.00
Total patient-paid spending	$225.00

Time and help

Measure	Recorded value
Missed work	3 days
Unpaid caregiver help	8 hours
Chosen workday value	$120 per day
Separate work-loss illustration	3 days x $120 = $360

The $360 work-loss illustration is separate from the $225 paid. Caregiver hours remain hours. Insurer payments are outside patient-paid spending.

Questions for my visit

What could explain my symptoms? Is testing appropriate, and does timing matter? What would the visit and any tests cost? What follow-up should I plan?

What would help

Help preparing for care, understanding coverage and arranging transportation if needed.

Review before sharing. The live app lets people correct or clear entries and download their own summary and visual. This fictional attachment follows the same cost categories; it is not a screenshot or an export from a real person.

Evidence & Calculations

Hudson Valley pilot view | Dutchess and Orange counties

What the county cost illustration means

The illustration multiplies official 2024 reported Lyme cases by published study costs. It makes the scale of community burden visible while keeping observed case counts separate from transferred cost assumptions.

Measure	Dutchess	Orange	Combined
2024 reported cases	1,060	964	2,024
Medical illustration	$1,412,980	$1,285,012	$2,697,992
Other expenses + lost productivity	$740,940	$673,836	$1,414,776
Societal illustration	$2,153,920	$1,958,848	$4,112,768

Calculation basis

Hook et al. (2022): weighted mean societal cost **$2,032 per participant**, in 2016 dollars, with 613 participants in the societal-cost analysis. Medical reference: **$1,333**. The **$699** other/productivity amount is the calculated remainder, $2,032 minus $1,333; it is not a separately estimated travel or work-loss mean.

Example: Dutchess total = 1,060 x $2,032 = $2,153,920. Orange total = 964 x $2,032 = $1,958,848. Components reconcile to the combined total.

Interpretation

These are historical-dollar illustrations, not measured county spending, individual bills or demonstrated savings. They do not adjust for regional prices, local disease mix, underreporting, inflation or diagnostic delay. They are not a full lifetime estimate of persistent illness. Medication estimates must not be added again to a baseline that already includes medical costs.
